

PRESS RELEASE

Com'in chooses RUBIX S&I as an exclusive partner for the analysis of atmospheric nuisances

20/04/2020

In a context of demographic explosion and increasing urbanization, construction and industrial companies must more than ever ensure respect for the quality of the environment, in particular for employees and neighboring populations.

Com'in, a start-up from the Bouygues Group's Intrapreneurship program, was created in 2019 to address these issues. It develops Shared Intelligence solutions, in particular for identifying and controlling nuisances, based on IoT (Internet of Things, Internet of Things) and Artificial Intelligence technologies.

RUBIX S&I has developed the WT1, an extremely complete and sophisticated monitoring station, allowing in particular to measure and identify particles (1 μm , 2.5 μm and 10 μm), dust, up to 7 different gases, Volatile Organic Components and Odors.

The integrated sensors are configured according to the activity monitored, to better control the associated nuisances.

WT1 stations are connected via a 4G or WiFi network to the Com'in NuisAlgo® analysis platform. They identify the sources of nuisance, then the platform analyzes, in real time, these records to send alerts if the authorized

thresholds are exceeded. This information can be viewed and shared from a web browser on any device connected to the internet.

With RUBIX S&I, Com'in contributes to the constant improvement of the environment by controlling atmospheric pollution. By knowing precisely, and in real time, the nature of these pollutants emitted by their activities, operations managers have an essential decision-making tool to make relevant choices while respecting the environment and the health of employees and residents.

"We are very pleased to partner with Com'in to share our expertise in monitoring air quality and identifying and recognizing dust. We are convinced of the relevance of this joint offer, whose high quality standards allow us to meet the needs of both principals and citizens. The solution is already in place on Ile de France sites (Grand Paris Express) and we anticipate very strong growth in our solution. »Declares Jean Christophe MIFSUD, CEO Founder of RUBIX S&I.

"We are very excited to become a partner of RUBIX S&I. Its high know-how technology, associated with our business knowledge, will allow us to build together Shared Intelligence solutions allowing in particular the construction sector, on an international scale, to better control the impact of its operations on the environment and on human health . "Declares Laurent MAREUGE, Founding CEO of Com'in. Com'in aims to respond to all dimensions of nuisance from construction or industrial operations (sound, vibration, air, mobility, etc.). Com'in aims to partner with benchmark partners in each of these areas to offer a global solution to pollution control and thus contribute to "living well together". ABOUT COM'IN Com'in is a Start-up, resulting from the Bouygues Group's Intrapreneurship program, created in 2019. It builds Shared Intelligence solutions, based on IoT and Artificial Intelligence technologies, which improve the environment for construction or industrial operations. ABOUT RUBIX S&I RUBIX S&I is one of the world leaders in the analysis and identification

of air pollutants since 2016. RUBIX S&I develops different solutions for air quality analysis, outside or inside, whether in buildings, in transport (planes, trains, cars) or in homes (ovens, refrigerators, ventilation). PRESS
